

Assignment on Modulo and Multiplicative Inverse1. $-17 \bmod 23$?

$$23 \mid -17 \mid -1$$

$$(11 \text{ bonr}) \equiv \frac{-23}{6}$$

Cross verification using remainder theorem;

$$-17 = 23 \times (-1) + 6$$

$$\Rightarrow -17 = -23 + 6$$

$$\Rightarrow -17 = -17$$

(Proved)2. Multiplicative inverse of -13 upon modulo 23 ? \Rightarrow Inverse exist if $\gcd(a, m) = 1$ Now, we can say $a \cdot x = 1 \pmod{m}$ Here $a = -13$ $m = 23$

$$-13x = 1 \pmod{23}$$

Here, x is the multiplicative inverse. For the value of x , remainder will be one. $x = 7$ will be satisfied this. $23 \mid -91 \mid -4$

$$\frac{-92}{-1} \quad \underline{\text{Ans}}$$
